Progressive Expands Standard Component Offering

New v12 Catalog Set for Release at NPE 2018

Wauconda, IL – Progressive Components has been developing mold component innovations for nearly three decades, with many items becoming global industry standards. Products have been released in versions, and at NPE 2018 Progressive is set to introduce its new v12 Catalog.

New product advantages include:

- A variety of standard mold base components to complement our existing line.
- New cooling products that are readily machined and reach throughout cores previously not feasible.
- Expanded through-hardened pins for large automotive and appliance tools.
- Advancements in mold maintenance and monitoring technology.
- New alignment lock configurations.

“Progressive’s v12 Catalog provides new, standardized options for plate sequencing, routing cooling where previously not economical, and eliminating custom per mold machining with new ejection and alignment standards,” states Glenn Starkey, President of Progressive Components. “Adding to that, we’re advancing our mold maintenance and monitoring technology, so whether you build, buy or run molds, accessing the v12 Progressive catalog will only benefit your tooling programs ahead.”

With the debut of the V12 Catalog in May 2018, Progressive will have the largest and most comprehensive product line offering in their company’s history.
